This sequence represents a PCR primer for the Neisseria alpha-2,3-sialyltransferase coding sequence. The invention relates to a nucleic acid encoding a fusion protein that comprises a glycosyltransferase

A new glycosyltransferase fusion protein useful in the enzymatic synthesis of oligosaccharides.

Example 1; Page 40; 63pp; English.

          AAV01427-V01430 are PCR primers used in the amplification of novel alpha-2,3-sialyltransferase from Neisseria meningitidis and Neisseria gonorrheae. The protein can be used as a resgent for adding a sialic acid residue to an acceptor having a terminal galactose residue, e.g. in synthesis of biologically active oligosaccharides or sialyl-modified proteins or lipids. The nucleic acid sequence can be used for the recombinant production of alpha-2,3-sialyltransferase
                                                                                                                                                                               Nucleic acid sequence encoding Neisseria alpha-2,3-sialyl:transferase useful to add sialic acid to acceptor with terminal galactose residue synthesis of biologically active oligosaccharide.
                                                                                                                                                   Example 2; Page 25; 50pp; English
                                                                                                                                                                                                                                                              WPI; 1998-052313/05.
                                                                                                                                                                                                                                                                                               Gilbert M,

The fusion protein is useful in the catalyse more than one reaction involved in the fusion proteins are able to is useful for the development of therapeutic agents that have specific carbohydrate structures. Carbohydrates are involved in recognition such the surface of cells. The fusion protein can be used for the synthesis of the synthesis of the synthesis of both natural carbohydrates and synthetic derivatives with reactions in a single vessel, provides improved yields of end products. Teduced. The fusion protein can be used for the source of the synthesis of the surface of cells. The fusion synthetic derivatives with reactions in a single vessel, provides improved yields of end products is reduced. The fusion protein can also use directly different donor analyses and various and various and various arith a transital loss.
                                                                                                                                                                                                                                                                                                                                 (CANA ) NAT

                                                                                                                                                                                         The present sequence represents a PCR primer for the Campylobacter jejuni cst-I gene which encodes alpha-2,3-sialyltransferase. The alpha-2,3-sialyltransferase protein is useful for producing desired carbobydrate structures by contacting the acceptor molecule (which has a terminal galactose residue) with an activated sialic acid molecule. The terminal galactose residue is linked to a second residue (Glc or a GlcNac, or GlcNac or GalNac) in the acceptor molecule through a beta-1,3 or beta-1,4 linkage, respectively. The activated sialic acid is CMP-Neu5Ac. The polynucleotides and polypeptides facilitate the improved production of desired structures and nucleic acids encoding sialyltransferases
                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                             Disclosure;
                                                                                                                                                                                                                                                                                                                                                       New sialyltransferases useful for adding sialyl residues to acceptor
                                                                                                                                                                                                                                                                                                                                                                                                            Gilbert M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence encodes the kinesin, KSPL360, which may be used in the method of the invention to screen for drug candidates and bloactive agents. The method comprises combining the candidate and a cell expressing recombinant KSP, and determining the effect of the candidate on the bloactivity of recombinant KSP. Changes in the bloactivity of KSP may be determined by assays for determining changes in the mitotic spindle, particularly inhibition of mitosis, and ATP hydrolysis. It may also be determined by performing assays to determine the effect of candidate agents on apoptosis and necrosis. The method of the invention is useful for screening for drug candidates (especially bloactive agents and proteins) which effect the bloactivity of KSP, binding to KSP and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes the kinesin, KSP-K491, which may be used in the method of the invention to screen for drug candidates and bloactive agents. The method comprises combining the candidate and a cell expressing recombinant KSP, and determining the effect of the candidate on the bloactivity of recombinant KSP. Changes in the bloactivity of KSP may be determined by assays for determining changes in the mitotic spindle, particularly inhibition of mitosis, and ATP hydrolysis. It may also be determined by performing assays to determine the effect of
                                                                                                                                                                                                                                                                                                                                                                                                                                               Microtubule stimulated ATPase; cellular proliferation; cancer; AIDS; hyperplasia; restenosis; cardiac hypertrophy; immune disorder; HIV; inflammation; autoimmune disease; arthritis; graft rejection; psoriasis; inflammatory bowel disease; proliferation; medical procedure; surgery; human immunodeficiency virus; acquired immunodeficiency syndrome; angioplasty; human; HsKif4; kinesin family; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           candidate agents on apoptosis and necrosis. The method of the invention is useful for screening for drug candidates (especially bioactive agents and proteins) which effect the bioactivity of KSP, binding to KSP and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 7
                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC The present invention relates to a new method of screening modulators of CC target protein with microtubule stimulated ATPase activity. The method CC involves contacting the target protein with an agent at 1st and 2nd CC concentrations and determining the level of activity (e.g. binding or CC ATPase activity) of target protein where a difference between levels of CC activity of target protein contacted with 1st and 2nd concentrations of CC an agent indicates that an agent modulates activity of target protein. CC having microtubule stimulated ATPase activity. The compounds identified CC including cancer, hyperplasias, restenosis, cardiac hypertrophy, immune CC disorders and inflammation. The compounds identified by the method are inflammatory bowel disease, proliferation induced by medical procedures, cc 9. surgery, angioplasty ecc. The compounds are also useful for treating autoimmune disease, arthritis, graft rejection, CC e.g. surgery, angioplasty ecc. The compounds are also useful for treating course (HIV) and thus treating acquired immunodeficiency syndrome (AIDS). CC The present nucleic acid sequence encodes the human HsKif4 (kinesin XXX)
                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAV10119 standard; DNA; 867
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes the kinesin, KSP-S553, which may be used in the method of the invention to screen for drug candidates and bioactive agents. The method comprises combining the candidate and a cell expressing recombinant KSP, and determining the effect of the candidate on the bioactivity of recombinant KSP. Changes in the bioactivity of KSP may be determined by assays for determining changes in the mitotic spindle, particularly inhibition of mitosis, and ATP hydrolysis. It may candidate agents on apoptosis and necrosis. The method of the invention is useful for screening for drug candidates (especially bioactive agents and proteins) which effect the bioactivity of KSP, binding to KSP and/or expression of KSP, where the cells are cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1728 BP; 594 A; 291

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes a human H11 monoclonal antibody single chain V region fragment (H11-scFv) construct which is capable of forming dimers. This construct is used to determine the ability of H11-scFv antibody fragments to bind specifically to the C-antigen on cancer cells. Such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polynuclectide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for gene therapy. The human monoclonal antibody (MAb), designated H11, specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma and monocarcinoma, small cell lung carcinoma, colon adenocarcinoma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human monoclonal antibody H11-single chain variable region (scFv) DNA #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antigen binding fragment from monoclonal antibody, H11 - allows tumour specific detection and treatment of neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      04-JUL-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc single chain variable region (scFv). The Hill light chain variable region cc single chain variable region (scFv). The Hill light chain variable region through a (SGGGG) 3 linker to consider the heavy chain variable region through a (SGGGG) 3 linker to consider the first consideration relates to human monoclonal antibody (Mab) cc Hil, Hil-(scFv) single chain variable (V) region fragment and their corresponding DNA molecules. Hil antibody is an immunoglobulin of IgM could subclass which is specific to C-antigen found specifically on neoplastic cells and not on normal cells. Hil is an antibody obtained from the cells and not on normal cells. Hil is an antibody obtained from the compared ploma and fused to a human myeloma cell line to produce a chybridoma designated NBGM1/HIL A pharmaceutical composition comprising composition designated NBGM1/HIL A pharmaceutical composition comprising constitutes are useful in the diagnosis, imaging and creatment of neoplastic disease, particularly, melanoma, breast coarcinoma, lung carcinoma, prostatioma, gastric carcinoma, prostate carcinoma, small cell lung carcinoma, neuroblastoma, glioma, soft tissue sarcoma, small cell lung carcinoma, prostatic adenocarcinoma, soft call lymphomas and chronic leukaemias. Hil DNA is also used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       variable region (SCFV) complementary DNA. The invention relates to human conclonal antibody (Mab) H11, H11-(SCFV) single chain variable (V) immunoglobulin of IgM subclass which is specific to C-antigen found to specifically on neoplastic cells and not on normal cells. H11 antibody is an CC specifically on neoplastic cells and not on normal cells. H11 is an CC year old male with a low grade glioma and fused to a human myeloma cell CC inte to produce a hybridoma designated MBGM/H11. A pharmaceutical CC diagnosis, imaging and treatment of neoplastic disease, particularly, carcinoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon carcinoma, gastric carcinoma, prostate carcinoma, lung carcinoma, lung carcinoma, lymphoma carcinoma, carcinoma, gastric carcinoma, prostate carcinoma, lung carcinoma, small cell lung carcinoma, colon carcinoma, glioma, soft tissue sarcoma, small cell lung carcinoma, colon carcinoma, soft tissue sarcoma, small cell lung carcinoma, carcinoma, small cell selection c

cc fragment of a monoclonal antibody specific for an antigen binding complastic cells. The antigen binding fragment (ABF) is useful for treating a patient with a neoplasia. The individual has a clinically content of the tumour. The method is useful for palliating the neoplasia. The individual has a clinically content of the antigen binding fragment (ABF) is useful for palliating the neoplasia. The method is useful for palliating the neoplasia. The method is useful for palliating the neoplasia. The content of a clinically detectable tumour. Cc as radioisotopes or immunomodulators. ABF is useful for detecting C-c antigen in a sample. The polypeptide is useful for diagnosing, localising conditions of the sum of the polypeptide is useful for manufacturing novel respents and for treating and imaging composition is useful for eliciting an immune response against neoplasia. Cc rantigen specific antibody, termed Hil or alphaC, as hybridisation of composition is useful for eliciting an immune response against neoplasia. Cc cantigen specific antibody, termed Hil or alphaC, as hybridisation of composition as sample, as primers to effect amplification of desired compositions including vaccines and compositions including vaccines and composition as a polynucleotide is also useful for genetically composition are useful for detecting contering cells in vivo, thus treating various types of cancer. The composition fragment, scFv, #2 DNA continued to the numan C-antigen specific antibody Hil single chain

The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of the antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types of cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition useful for treating neoplasia in patient, comprises antigen binding fragment of antibody specifically recognizing C-antigen recognized by antibody comprising H chain V region and L chain V region.

The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of the antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types of cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFv) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; virucide; hepatotropic; antiinflammatory; neuroprotective; immunosuppressive; antiarthritic; cytokine receptor; interferon; IFN; cancer; haematological malignancy; viral infection; hepatitis; human; multiple sclerosis; autoimmune disease; arthritis; ds; gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition useful for treating neoplasia in patient, comprises antigen binding fragment of antibody specifically recognizing C-antigen recognized by antibody comprising H chain V region and L chain V region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC This invention relates to a novel cytokine receptor binding peptide CC construct comprising a cytokine receptor binding domain incorporated in a CC suitable molecular scaffold so that the scaffold maintains the binding CC domain in a configuration suitable for binding to the cytokine receptor. The peptides of the invention may have cytostatic, virucide, antiinflammatory, neuroprotective, immunosuppressive and CC entiarthritic activities. A new interferon receptor binding peptide CC (IFN) mimetic. A peptide that mimics the effect of IFN is useful in the manufacture of a medicament as an interferon CC medical therapies for cancer, haematological malignancies, viral CC infections (hepatitis B or C), multiple sclerosis and autoimmune diseases CC such as arthritis, to detect modulators of IFN action, in screening cassays to compare the activity and/or interaction with another molecule cor potential IFN modulator and also in the diagnosis of IFN activity CC related disorders. A nucleic acid encoding the peptide of the invention CC conditions. The peptide of the invention has less side effect than those CC of native cytokines. The present sequence represents an interferon to condition binding peptide associated DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                          This sequence encodes a human H11 monoclonal antibody single chain V region fragment (H11-scFv) construct which is capable of forming monomers. This construct is used to determine the ability of H11-scFv antibody fragments to bind specifically to the C-antigen on cancer cells. Such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polynucleotide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for gene therapy. The human monoclonal antibody (MAD), designated H11, specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma and proteirs adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and proteirs adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and
                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen binding fragment from monoclonal antibody, H11 - allows tumour specific detection and treatment of neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dan

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The cDNA was directionally cloned into lambda Zap II (Stratagene) in the EcoRI (5') and XinoRI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome Research 6: 791-806."

BonaIdo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with oligo-dT
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with Not I and then cloned
directionally into pyx-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is GATMAAGGCCA. Tissue was provided by Mary Hendrix."
